TO BIOLOGISTS AND BIOCHEMISTS

The laying of this cornerstone for the new office building of the Federation of American Societies for Experimental Biology represents a significant step in the growth of an organization which has contributed much to the cooperative development of the various biological disciplines. In a real way this building symbolizes the tremendous expansion in biological research and especially the integrated nature of interdisciplinary activities which has been so productive of novel ideas. As one who has had the privilege of contributing in a small way to these developments, it gives me deep satisfaction and my appreciation of the foresight and constructive imagination of those who have made possible this sound growth of the Federation.

H. E. Carter, Head
Department of Chemistry and Chemical Engineering
